On average, only I4. A high-pass filter removes the lower frequencies, and the lowest frequency that can be identified with this technique is the reciprocal of twice the TR. Figure 1. Still their technical disadvantages have spurred researchers to try more advanced ways to increase the power of both clinical and research studies. Physiological noise is from head and brain movement in the scanner from breathing, heart beats, or the subject fidgeting, tensing, or making physical responses such as button presses. If the classifier is linear, then the training model is a set of weights used to scale the value in each voxel before summing them to generate a single number that determines the condition for each testing set trial.

Vessel wall magnitude and phase measurements: ROIs from the top to the bottom type of testing does not pertain to real life. Springer Verlag, Berlin,
